

AMENDMENT TO THE CLAIMS

1. (Currently Amended) An optical sensor assembly for tracking movement of a surface comprising:

a target comprising said surface movably mounted to present a varying segment of said surface to a focus area; and

an optical sensor comprising a single sensing component, said sensing component mounted facing said surface of said target at said focus area, wherein the single sensing component of said optical sensor detects a change in position of said surface in multiple directions.

2. (Currently Amended) The optical sensor assembly of claim 1 wherein said optical sensor is positioned substantially beneath said surface.

3. (Currently Amended) The optical sensor assembly of claim 1 wherein said target is cylindrical, said optical sensor is aligned placing said focus area perpendicular to a longitudinal axis of said cylinder and said surface is the circumferential surface of said cylinder.

4. (Currently Amended) The optical sensor assembly of claim 3 wherein said cylinder has a diameter greater than approximately 8mm.

5. (Currently Amended) The optical sensor assembly of claim 4 wherein said cylinder has a diameter between approximately 8mm and 12mm.

6. (Currently Amended) The optical sensor assembly of claim 3 wherein said surface tracked by said optical sensor is textured.

7. (Currently Amended) The optical sensor assembly of claim 1 wherein said surface is adapted to move vertically and the response of said optical sensor is substantially invariant to said vertical motion.

B6
cont
8. (Currently Amended) The optical sensor assembly of claim 7 wherein said optical sensor is positioned perpendicular to and beneath said surface.

9. (Currently Amended) The optical sensor assembly of claim 7 further comprising a switch disposed beneath a portion of said surface, wherein said vertical movement of said surface activates said switch.

10. (Original) A mouse replacement device comprising said optical assembly of claim 1 and a rollerbar having a left end and a mounting end, wherein said rollerbar is adapted to traverse a left travel distance and an activation distance, and said focus area is located at approximately the sum of two times said left travel distance plus said activation distance from said left end of said roller bar.

11. (Original) The mouse replacement device of claim 10 wherein said rollerbar has a first portion having a shiny hard surface and

a second portion having a textured surface, said sensing component focused on said second portion.

12.-47. (Canceled)

48. (Currently Amended) The optical sensor assembly of claim 7 wherein said optical sensor moves with said surface maintaining a constant distance and orientation to said surface.

49. (Canceled)

50. (Currently Amended) A cursor control device comprising:
a base;
a support mechanism supported on said base;
a target comprising a surface movably mounted on said support mechanism to present a varying segment of said surface to a focus area; and

an optical sensor comprising a single sensing component, said sensing component mounted facing said surface of said target at said focus area, wherein the single sensing component of said optical sensor detects a change in position of said surface in multiple directions.

51. (Previously Presented) The cursor control device of claim 50, wherein the support mechanism comprises a member extending from a first end to a second end.

52. (Previously Presented) The cursor control device of claim 50, wherein the support mechanism comprises a member extending

from a support element at a first end to a support element at a second end.

53. (Previously Presented) The cursor control device of claim 50, wherein the support mechanism comprises a member extending from a support element at a first end to a spring member at a second end.

54. (Previously Presented) The cursor control device of claim 50, wherein the support mechanism comprises a member extending from a mount at a first end to a switch mechanism at a second end, the support member disposed for reciprocal translation having a vertical component into and out of contact with the switch mechanism.

55. (Previously Presented) The cursor control device of claim 50, wherein the surface is rollably supported by said support mechanism.

56. (Previously Presented) The cursor control device of claim 50, wherein the surface is rollably supported by a bearing mechanism on said support mechanism.

57. (Previously Presented) The cursor control device of claim 50, wherein the surface is translatably supported by said support mechanism.

58. (Previously Presented) The cursor control device of claim 50, wherein the surface is translatably supported by a bearing mechanism on said support mechanism.

59. (Previously Presented) The cursor control device of claim 50, wherein the surface comprises a sleeve rotatable via a bearing mechanism around the support mechanism and translatably along the support mechanism, rotation and translation of the sleeve being interpretable by the sensor.

60. (Previously Presented) The cursor control device of claim 50, wherein the surface has a matte texture.

61. (Previously Presented) The cursor control device of claim 50, wherein the surface is texturized.

62. (New) The optical sensor assembly of claim 1, wherein the surface of said target is rounded.

63. (New) The optical sensor assembly of claim 1, wherein the surface of said target is curved.

64. (New) The optical sensor assembly of claim 1, wherein the surface of said target is cylindrical.

65. (New) The optical sensor assembly of claim 1, wherein the surface of said target comprises a rollerbar.

66. (New) The optical sensor assembly of claim 1, wherein the surface of said target comprises a rollerball.

67. (New) The optical sensor assembly of claim 1, wherein the surface of said target comprises a surface supported by a rolling mechanism.

68. (New) The optical sensor assembly of claim 1, wherein said surface is translatably and rollably mounted to present the varying segment of said surface to the focus area.

Cont B^u
69. (New) The optical sensor assembly of claim 1, wherein the single sensing component is operative to sense translational motion and rolling motion of said surface.

70. (New) The optical sensor assembly of claim 1, wherein said surface is translatably and rotatably mounted to present the varying segment of said surface to the focus area.

71. (New) The optical sensor assembly of claim 1, wherein the single sensing component is operative to sense translational motion and rotational motion of said surface.

72. (New) The cursor control device of claim 50, wherein the surface of said target is rounded.

73. (New) The cursor control device of claim 50, wherein the surface of said target is curved.

74. (New) The cursor control device of claim 50, wherein the surface of said target is cylindrical.

75. (New) The cursor control device of claim 50, wherein said surface is translatably and rollably mounted to present the varying segment of said surface to the focus area.

76. (New) The cursor control device of claim 50, wherein the single sensing component is operative to sense translational motion and rolling motion of said surface.

*B6
cont*
77. (New) The cursor control device of claim 50, wherein said surface is translatably and rotationally mounted to present the varying segment of said surface to the focus area.

78. (New) The cursor control device of claim 50, wherein the single sensing component is operative to sense translational motion and rotational motion of said surface.

79. (New) The cursor control device of claim 50, wherein the support mechanism comprises a member extending from a first end to a second end, the member cantilevered from a mount at the first end.

80. (New) The cursor control device of claim 79, wherein the first end of the member extends from the mount at an upward angle to form a bow in the member between the first end and the second end.

81. (New) The cursor control device of claim 79, wherein the second end floats on a switch in a rest position.

82. (New) The cursor control device of claim 50, wherein the support mechanism comprises a member having a bowed shape from a first end to a second end.

83. (New) The cursor control device of claim 50, wherein the support mechanism comprises a springy member having a bowed shape from a first end to a second end.

84. (New) The cursor control device of claim 83, further comprising a tension adjustment device disposed to adjust the bowed shape of the springy member.

85. (New) The cursor control device of claim 84, wherein the tension adjustment device is disposed to adjust the angle of the springy member from horizontal at the first end.
